Concept	1-Categorical construction	$\infty$ -Categorical construction	Intuition
Accessible category	$\mathcal{C}$ is locally small, admits $\kappa$ - filtered colimits, and there is a set of $\kappa$ -compact objects that generate the category under $\kappa$ - filtered colimits. ([nLa25a], Def 2.1)	$\mathcal{C}$ is locally small, admits $\kappa$ -filtered colimits, the full subcategory $\mathcal{C}^{\kappa} \subseteq \mathcal{C}$ of $\kappa$ -compact objects is essentially small, and $\mathcal{C}^{\kappa}$ generates $\mathcal{C}$ under small, $\kappa$ -filtered colimits. ([Lur09], Prop 5.4.2.2)	[todo]
F-Cartesian edge	$F: X \to S$ a functor, $f: x \to y$ a morphism in $X$ is $F$ -cartesian if the induced map $X_{/f} \to X_{/y} \times_{S_{/F(y)}} S_{/F(f)}$ is an isomorphism of categories. ([nLa25b], Prop 2.4)	$F: X \to S$ an inner fibration of simplicial sets, $f: x \to y$ an edge in $X$ is $F$ -cartesian if the induced map $ X_{/f} \to X_{/y} \times_{S_{/F(y)}} S_{/F(f)} $ is a trivial Kan fibration. ([Lur09], Def 2.4.1.1)	In the model structure on sSet, the fibrations are Kan fibrations and the weak equivalences are weak homotopy equivalences ([Lur09], A.2.7). A trivial fibration in a model category is a map which is both a fibration and a weak equivalence, which in sSet is equivalent to the definition given in this table. Thus, being related by a Kan fibration is a higher categorical notion of 'sameness'. Why not a categorical equivalence? [Lur09] Rem 1.2.5.5 implies this is stronger, which would match more with the fact that the 1-categorical version is defined in terms of an isomorphism (not equivalence) of categories.
Category	Collection of objects $C$ , set $\operatorname{Hom}(X,Y)$ for every $X,Y\in C$ , associative composition and identity morphisms	Simplicial set $C: \Delta^{\text{op}} \to \mathbf{Set}$ satisfying the inner horn filling condition. ([Lur09], Def 1.1.2.4)	Category with objects $C_0$ , morphisms $C_1$ , morphisms between morphisms $C_2$ , etc. Inner horn filling defines a non-unique composition.
F-Cocartesian edge	$F: X \to S$ a functor, $f: x \to y$ a morphism in $X$ is $F$ -cocartesian if the induced map $X_{f/} \to X_{x/} \times_{S_{F(y)/}} S_{F(f)/}$ is an isomorphism of categories. ([nLa25b], Prop 2.4)	$F: X \to S$ an inner fibration of simplicial sets, $f: x \to y$ an edge in $X$ is $F$ -cartesian if the induced map $X_{f/} \to X_{x/} \times_{S_{F(y)/}} S_{F(f)/}$ is a trivial Kan fibration. ([Lur09], Def 2.4.1.1 / Prop 2.4.1.8)	Note that the definitions of an inner fibration and a Kan fibration are invariant under taking opposites. For other intuition, see: F-cartesian edge.
Colimit	A colimit for $F: J \to \mathcal{C}$ is an initial cocone on $F$ .	A colimit for $F: X \to \mathcal{C}$ (X a simplicial set, $\mathcal{C}$ an $\infty$ -category) is an initial object of $\mathcal{C}_{F/}$ . ([Lur09], Def 1.2.13.4)	The obvious extension of the definition of the undercategory $\mathcal{C}_{C/}$ for $C: \{*\} \to \mathcal{C}$ to $\mathcal{C}_{/F}$ for an arbitrary functor $F: J \to \mathcal{C}$ ends up being exactly $\mathbf{Cocone}(F)$ .
$\kappa$ -Compact object	Let $C \in \mathcal{C}$ , and let $j_C : \mathcal{C} \to \mathbf{Set}$ denote the functor represented by $C$ . If $\mathcal{C}$ admits $\kappa$ -filtered col- imits, then $C$ is $\kappa$ -compact if $j_C$ commutes with filtered colimits. ([Lur09], 5.3.4)	Let $C \in \mathcal{C}$ , and let $j_C : \mathcal{C} \to \hat{\mathcal{S}}$ denote the functor represented by $C$ . If $\mathcal{C}$ admits $\kappa$ -filtered colimits, then $C$ is $\kappa$ -compact if $j_C$ preserves $\kappa$ -filtered colimits. ([Lur09], Def 5.3.4.5)	[todo]
Dual object	[todo]	[todo]	[todo]
Essentially small category	$\mathcal{C}$ equivalent to a small category.	$\mathcal{C}$ equivalent <sup>2</sup> to a small $\infty$ - category.	[todo]

<sup>&</sup>lt;sup>1</sup>Lurie introduces the term  $\kappa$ -continuous for such functors, but in ordinary category theory this generally means a functor which preserves  $\kappa$ -small limits; a functor preserving  $\kappa$ -filtered colimits is called  $\kappa$ -finitary. I have thus steered clear of this term.

<sup>2</sup>Categorically, or weakly?

Essentially surjective functor	$F: \mathcal{C} \to \mathcal{D}$ is essentially surjective if for every $D \in \mathcal{D}$ , there ex-	$F: \mathcal{C} \to \mathcal{D}$ is essentially surjective if $hF: hC \to h\mathcal{D}$ is essentially sur-	Essentially surjective up to homotopy.
Faithful functor	ists some $C \in \mathcal{C}$ with $FC \cong D$ . $F : \mathcal{C} \to \mathcal{D}$ is faithful if $\operatorname{Hom}(X,Y) \to \operatorname{Hom}(FX,FY)$ is injective for all $X,Y \in \mathcal{C}$ .	jective. ([Lur09], Def 1.2.10.1) $F: \mathcal{C} \to \mathcal{D} \text{ is faithful if } hF:$ $h\mathcal{C} \to h\mathcal{D} \text{ is faithful. ([Lur09], Def}$ $1.2.10.1)$	Faithful up to homotopy.
$\kappa$ -Filtered category	For a regular cardinal $\kappa$ , $\mathcal{C}$ is $\kappa$ - filtered if, for every $\kappa$ -small cat- egory $J$ and every functor $F$ : $J \to \mathcal{C}$ , there exists a cocone on $F$ .	For a regular cardinal $\kappa$ , $\mathcal{C}$ is $\kappa$ - filtered if, for every $\kappa$ -small simpli- cial set $X$ and every map $f: X \to$ $\mathcal{C}$ , there exists a map $\overline{f}: K^{\triangleright} \to \mathcal{C}$ extending $f$ . ([Lur09], Def 5.3.1.7)	A cocone on $F$ is a collection of compatible maps $(\lambda_j : F(j) \to C)$ . Define $\overline{F} : J \star [0] \to C$ to be $F$ on $J$ , send the cone point to $C$ , and send the unique morphisms $*_j$ from $j \in J$ to the cone point to the $\lambda_j$ . Conversely, if you have some $\overline{F}$ extending $F$ , define $\lambda_j := F(*_j)$ .
Final object	Object $C \in \mathcal{C}$ such that for any other object $C' \in \mathcal{C}$ , there exists a unique morphism $C' \to C$ .	Object $C \in \mathcal{C}$ such that $C$ is final in $h\mathcal{C}$ , regarded as an enriched category over $\mathcal{H}$ . ([Lur09], Def 1.2.12.1)	Object $C \in \mathcal{C}$ such that for any other object $C' \in \mathcal{C}$ , there exists a unique (up to homotopy) morphism $C' \to C$ .
Full functor	$F: \mathcal{C} \to \mathcal{D}$ is full if $\operatorname{Hom}(X,Y) \to \operatorname{Hom}(FX,FY)$ is surjective for all $X,Y \in \mathcal{C}$ .	$F: \mathcal{C} \to \mathcal{D}$ is full if $hF: h\mathcal{C} \to h\mathcal{D}$ is full. ([Lur09], Def 1.2.10.1)	Full up to homotopy.
Functor	Functor.	Natural transformation of simplicial sets. ([Lur09], 1.2.7)	-
Groupoid	Category whose morphisms are all invertible.	Kan complex.	Not only can you find (non-unique) 'composites', but you can also fill in diagrams like $C \xrightarrow{\text{id}} C C \xrightarrow{\text{id}} D$ $f \downarrow \qquad $
Initial object	Object $C \in \mathcal{C}$ such that for any other object $C' \in \mathcal{C}$ , there exists a unique morphism $C \to C'$ .	Object $C \in \mathcal{C}$ such that $C$ is initial in $h\mathcal{C}$ , regarded as an enriched category over $\mathcal{H}$ . ([Lur09], Def 1.2.12.1)	Object $C \in \mathcal{C}$ such that for any other object $C' \in \mathcal{C}$ , there exists a unique (up to homotopy) morphism $C \to C'$ .
Join	$ \begin{array}{c} \mathcal{C}\star\mathcal{D} \text{ has objects ob}\mathcal{C}\sqcup\text{ob}\mathcal{D},\\ \text{and } \mathrm{Hom}_{\mathcal{C}\star\mathcal{D}}(X,Y) \text{ is given by:}\\ \left\{ \begin{aligned} &\mathrm{Hom}_{\mathcal{C}}(X,Y) & X,Y\in\mathcal{C},\\ &\mathrm{Hom}_{\mathcal{D}}(X,Y) & X,Y\in\mathcal{D},\\ &\emptyset & X\in\mathcal{D},Y\in\mathcal{C},\\ &* & X\in\mathcal{C},Y\in\mathcal{D}. \end{aligned} \right. \\ \left( [\mathrm{Lur09}],1.2.8 \right) $	$\mathcal{C} \star \mathcal{D}$ has $n$ -simplicies $(\mathcal{C} \star \mathcal{D}) = \mathcal{C}_n \cup \mathcal{D}_n \cup \bigcup_{i+j=n-1} \mathcal{C}_i \times \mathcal{D}_j$ . The $i$ th boundary map $d_i : (\mathcal{C} \star \mathcal{D})_n \to (\mathcal{C} \star \mathcal{D})_{n-1}$ is defined on $\mathcal{C}_n$ and $\mathcal{D}_n$ using the $i$ th boundary map on $\mathcal{C}$ and $\mathcal{D}$ . Given $\sigma \in S_j, \tau \in T_k$ , $d_i(\sigma, \tau)$ is given by $\begin{cases} (d_i \sigma, \tau) & i \leq j, \ j \neq 0, \\ (\sigma, d_{i-j-1}\tau) & i > j, \ k \neq 0. \end{cases}$ If $j = 0$ , then $d_0(\sigma, \tau) = \tau$ , and if $k = 0$ , then $d_n(\sigma, \tau) = \sigma$ . ([Lur09], Def 1.2.8.1 / [nLa25c])	Objects are in both cases disjoint unions of objects from the two categories being joined. Morphisms are also exactly the same in both cases (you get all the morphisms from $\mathcal{C}$ and $\mathcal{D}$ , plus a morphism from $c \to d$ for every pair $(c,d) \in \mathcal{C}_0 \times \mathcal{D}_0$ ). Whenever you have an $n$ -simplex in $\mathcal{C}$ and an $m$ -simplex in $\mathcal{D}$ , you get an $(m+n+1)$ -simplex in $\mathcal{C} \star \mathcal{D}$ , so in particular $\Delta^n \star \Delta^m \cong \Delta^{m+n+1}$ .
Left cone	$\mathcal{C}^{\triangleleft} := [0] \star \mathcal{C}.$	$ \begin{array}{ccc} \mathcal{C}^{\triangleleft} &:= \Delta^{0} \star \mathcal{C}. & ([\text{Lur09}], \text{ Not} \\ 1.2.8.4) \end{array} $	$\mathcal{C}$ with extra vertex (cone point) added, as well as a map from that cone point to every other vertex in $\mathcal{C}$ (plus obligatory degenerate simplicies).

Left Kan extension	Given a commutative diagram	Given a commutative diagram	In the 1-categorical case, the col-
(along the inclusion of a full subcategory)	$C^0 \xrightarrow{F_0} \mathcal{D}$ , $F$ is a left Kan extension of $F_0$ along $\iota$ if there is a natural transformation $\eta: F_0 \to F\iota$ such that for any other pair $(G: \mathcal{C} \to \mathcal{D}, \gamma: F_0 \to G\iota)$ , there exists a unique natural transfor-	Given a commutative diagram $C^0 \xrightarrow{F_0} D$ , $F$ is a left Kan extension of $F_0$ along $\iota$ if for all $C \in C$ , the induced diagram $C^0_{/C} \xrightarrow{F_C} D$ exhibits $FC$ as	imit of $C_{/C}^0 \to C^0 \xrightarrow{F_0} \mathcal{D}$ for each $C \in \mathcal{C}$ defines the left Kan extension of $F_0$ along $\iota$ ([Rie16], Thm 6.2.1). I think Lurie is saying exactly the same thing in the $\infty$ -categorical case, just in a slightly confusing way.
	mation $\alpha: F \to G$ such that $\gamma = (\alpha * \iota) \circ \eta$ . ([Rie16], Def 6.1.1)	$(\mathcal{C}_{/C}^{0})^{\triangleright}$ a colimit of $F_{C}$ . ([Lur09], Def 4.3.2.2)	
Limit	A limit for $F: J \to \mathcal{C}$ is a terminal cone on $F$ .	A limit for $F: X \to \mathcal{C}$ (X a simplicial set, $\mathcal{C}$ an $\infty$ -category) is a final object of $\mathcal{C}_{/F}$ . ([Lur09], Def 1.2.13.4)	The obvious extension of the definition of the overcategory $\mathcal{C}_{/C}$ for $C: \{*\} \to \mathcal{C}$ to $\mathcal{C}_{/F}$ for an arbitrary functor $F: J \to \mathcal{C}$ ends up being exactly $\mathbf{Cone}(F)$ .
Locally small category	For every $X, Y \in \mathcal{C}$ , $\text{Hom}(X, Y)$ is a set.	For every $X, Y \in \mathcal{C}$ , the space $\operatorname{Hom}(X, Y)$ is essentially small. ([Lur09], Prop 5.4.1.7)	[todo]
Monoidal category	[todo]	Cocartesian fibration of $\infty$ - operads $\mathcal{C}^{\otimes} \to \mathbf{Assoc}^{\otimes}$ . ([Lur17], Def 4.1.1.10)	[todo]
(Coloured) operad	[todo]	[todo]	[todo]
Opposite category	$\mathcal{C}^{\mathrm{op}}$ has the same objects as $\mathcal{C}$ , and $\mathrm{Hom}_{\mathcal{C}^{\mathrm{op}}}(X,Y) = \mathrm{Hom}_{\mathcal{C}}(Y,X)$ .	$C_n^{\text{op}} = C([n]^{\text{op}}), \text{ where } \{0 < 1 < < n\}^{\text{op}} = \{0 > 1 > > n\}.$ ([Lur09], 1.2.1)	A map $x \to y$ is an edge $\Delta^1 \to \mathcal{C}$ where $0 \mapsto x$ and $1 \mapsto y$ . In $\mathcal{C}^{\text{op}}$ 0 and 1 swap roles, so we instead get a map $y \to x$ .
Overcategory	For $C \in \mathcal{C}$ , the category $\mathcal{C}_{/C}$ satisfies the following universal property: for any category $\mathcal{D}$ , there is a bijection $\operatorname{Hom}(\mathcal{D},\mathcal{C}_{/C}) \simeq \operatorname{Hom}_{C}(\mathcal{D}\star[0],\mathcal{C}),$ where the subscript on the right indicates that we consider only those functors $\mathcal{D}\star[0] \to \mathcal{C}$ whose restriction to $[0]$ consides with $C$ . ([Lur09], 1.2.9)	For $f: S \to \mathcal{C}$ , $S$ a simplicial set and $\mathcal{C}$ an $\infty$ -category, the $\infty$ -category $\mathcal{C}_{/f}$ satisfies the following universal property: for any simplicial set $X$ , there is a bijection $\operatorname{Hom}(X,\mathcal{C}_{/f}) \simeq \operatorname{Hom}_f(X \star S,\mathcal{C}),$ where the subscript on the right indicates that we consider only those functors $X \star S \to \mathcal{C}$ whose restriction to $S$ consides with $f$ . Explicitly, $(\mathcal{C}_{/f})_n := \operatorname{Hom}_f(\Delta^n \star S,\mathcal{C}).$ ([Lur09], Prop 1.2.9.2)	If $S = \Delta^0$ , writing $C \in \mathcal{C}$ for the object picked out by $f$ , we have $(\mathcal{C}_{/C})_n = \operatorname{Hom}_C(\Delta^n \star \Delta^0, \mathcal{C}) \cong \operatorname{Hom}_C(\Delta^{n+1}, \mathcal{C})$ (where the subscript indicates that we only consider morphisms sending the $(n+1)$ st vertex to $C$ ). In other words, the objects are maps to $C$ , the morphisms are commuting triangles over $C$ , and so on; these are exactly the objects and morphisms in the 1-categorical case.
Presentable category	[todo]	[todo]	[todo]
Presheaf	[todo]	[todo]	[todo]
Representable functor	[todo]	[todo]	[todo]
Right cone	$\mathcal{C}^{ hd}:=\mathcal{C}\star[0].$	$\mathcal{C}^{\triangleright} := \mathcal{C} \star \Delta^{0}.$ ([Lur09], Not 1.2.8.4)	$\mathcal{C}$ with extra vertex (cone point) added, as well as a map from every other vertex in $\mathcal{C}$ to that cone point (plus obligatory degenerate simplicies).

Subcategory	Subcategory $\mathcal{C}'\subseteq\mathcal{C}.$	Subsimplicial set $\mathcal{C}' \subseteq \mathcal{C}$ arising as $\mathcal{C}' \longrightarrow \mathcal{C}$ a pullback $\downarrow \  \  \  \  \  \  \  \  \  \  \  \  \ $	Expected definition: Subsimplicial set $\mathcal{C}'\subseteq\mathcal{C}$ satisfying inner horn filling. These are actually equivalent: suppose we have a such a subsimplicial set. Then $\mathcal{C}'\longrightarrow\mathcal{C}$ is a pull- $N(h\mathcal{C}')\longrightarrow N(h\mathcal{C})$ back. Conversely, suppose we're given a pullback as in the box to the left. Then the diagram $\Delta^n \longleftrightarrow \Lambda^n_i$ $\mathcal{C}'\longrightarrow \mathcal{C}$ shows that $\mathcal{C}'$ also satisfies inner horn filling, where the outer two dotted maps come from horn filling for $\mathcal{C}$ and $N(h\mathcal{C})'$ , and the inner dotted map comes from the fact that the square is a pullback.
Symmetric monoidal category	[todo]	[todo]	[todo]
Symmetric monoidal functor	[todo]	[todo]	[todo]
Topos	[todo]	[todo]	[todo]
Undercategory	For $C \in \mathcal{C}$ , the category $\mathcal{C}_{C/}$ satisfies the following universal property: for any category $\mathcal{D}$ , there is a bijection $\operatorname{Hom}(\mathcal{D},\mathcal{C}_{C/}) \simeq \operatorname{Hom}_{C}([0]\star\mathcal{D},\mathcal{C}),$ where the subscript on the right indicates that we consider only those functors $[0]\star\mathcal{D}\to\mathcal{C}$ whose restriction to $[0]$ consides with $C$ . $([\operatorname{Lur}09], 1.2.9)$	For $f: S \to \mathcal{C}$ , $S$ a simplicial set and $\mathcal{C}$ an $\infty$ -category, the $\infty$ -category $\mathcal{C}_{f/}$ satisfies the following universal property: for any simplicial set $X$ , there is a bijection $\operatorname{Hom}(X,\mathcal{C}_{f/}) \simeq \operatorname{Hom}_f(S \star X,\mathcal{C}),$ where the subscript on the right indicates that we consider only those functors $S \star X \to \mathcal{C}$ whose restriction to $S$ consides with $f$ . Explicitly,	If $S = \Delta^0$ , writing $C \in \mathcal{C}$ for the object picked out by $f$ , we have $(\mathcal{C}_{C/})_n = \operatorname{Hom}_C(\Delta^0 \star \Delta^n, \mathcal{C}) \cong \operatorname{Hom}_C(\Delta^{n+1}, \mathcal{C})$ (where the subscript indicates that we only consider morphisms sending the 0th vertex to $C$ ). In other words, the objects are maps from $C$ , the morphisms are commuting triangles under $C$ , and so on; these are exactly the objects and morphisms in the 1-categorical case.
		$(\mathcal{C}_{f/})_n := \operatorname{Hom}_f(S \star \Delta^n, \mathcal{C}).$ ([Lur09], Prop 1.2.9.2)	

	Equivalences		
Name	Between	Definition	
Strong equivalence	Topological categories $\mathcal{C}, \mathcal{D}$	$\mathcal{C} \to \mathcal{D}$ is an equivalnce in the sense of enriched	
		category theory. ([Lur09], Def 1.1.3.1)	
(Weak) equivalence	Topological categories $\mathcal{C}, \mathcal{D}$	The induced functor $h\mathcal{C} \to h\mathcal{D}$ is an equiva-	
		lence of $\mathcal{H}$ -enriched categories. ([Lur09], Def	
		1.1.3.6)	
Categorical equivalence	Simplicial sets $X, S$	The induced functor $hX \to hS$ is an equiva-	
		lence of $\mathcal{H}$ -enriched categories. ([Lur09], Def	
		1.1.5.14)	
Weak (homotopy) equivalence	Simplicial sets $X, S$	The induced map $ X  \rightarrow  S $ is a weak	
		homotopy equivalence of topological spaces.	
		([Lur09], 1.1.4)	
Equivalence	Simplicial categories $\mathcal{C}, \mathcal{D}$	The induced functor $h\mathcal{C} \to h\mathcal{D}$ is an equiva-	
		lence of $\mathcal{H}$ -enriched categories. ([Lur09], Def	
		1.1.4.4)	

Fibrations and anodyne morphisms		
Name	Describes	Definition
Acyclic Kan fibration	$f: X \to S$ map of simplicial sets	see: trivial Kan fibration. ([nLa23])
Anodyne	$f: X \to S$ map of simplicial sets	For every solid arrow diagram as below, with
		$p: Y \to T$ a Kan fibration,
		$X \longrightarrow Y$
		$ \begin{array}{ccc} f \downarrow & \downarrow p \\ S & \longrightarrow T \end{array} $
		$S \xrightarrow{\sim} T$
Cartesian fibration	$f: X \to S$ map of simplicial sets	there exists a dotted lift. ([Lur09], Ex 2.0.0.1)  f is an inner fibration such that for every edge
Cartesian infration	$J: X \to S$ map of simplicial sets	$g: x \to y$ of S and every vertex $\tilde{y}$ of X with
		$f(\tilde{y}) = y$ , there exists an f-cartesian edge $\tilde{g}$ :
		$\tilde{x} \to \tilde{y}$ with $f(\tilde{g}) = g$ . ([Lur09], Def 2.4.2.1)
Categorical fibration	$f: X \to S$ map of simplicial sets	For every solid arrow diagram as below, with
		$p: Y \to T$ both a cofibration and a categorical
		equivalence,
		$V \longrightarrow V$
		$Y \longrightarrow X$ $\downarrow f$ $T \longrightarrow S$
		$T \longrightarrow S$
		there exists a dotted lift. ([Lur09], p90)
Cocartesian fibration	$f: X \to S$ map of simplicial sets	f is an inner fibration such that for every edge
		$g: x \to y$ of S and every vertex $\tilde{x}$ of X with
		$f(\tilde{x}) = x$ , there exists an f-cocartesian edge
Cofibration	$f: X \to S$ map of simplicial sets	$\tilde{g}: \tilde{x} \to \tilde{y} \text{ with } f(\tilde{g}) = g. \text{ ([Lur09], Def 2.4.2.1)}$ $f \text{ is a monomorphism. ([Lur09], A.2.7)}$
Inner anodyne	$f: X \to S$ map of simplicial sets	For every solid arrow diagram as below, with
inner anoughe	y 111 / S map of simplicial sees	$p: Y \to T$ an inner fibration,
		,
		$X \longrightarrow Y$
		$f \downarrow p$
		$S \xrightarrow{\checkmark} T$
		there exists a dotted lift. ([Lur09], Def 2.0.0.3)

$ \begin{array}{cccccccccccccccccccccccccccccccccccc$	Inner fibration	$f: X \to S$ map of simplicial sets	For every solid arrow diagram as below, with $0 < i < n$ ,
$F: C \to \mathcal{D} \text{ map of } \infty\text{-categories} \qquad F \text{ is an inner fibration such that for all } C \in \mathcal{C}$ and every isomorphism $u: D \to FC$ in $\mathcal{D}$ (i.e. $[u]$ is an isomorphism $u: D \to FC$ in $\mathcal{D}$ (i.e. $[u]$ is an isomorphism $u: D \to C$ in $C$ such that $F(\overline{u}) = u$ . $[Luv25, De DiEN]$ (Kan) fibration $f: X \to S \text{ map of simplicial sets}$ For every solid arrow diagram as below, with $0 \le i \le n$ , $A_i^n \longrightarrow X$ $\downarrow f$ $\downarrow f$ there exists a dotted lift. 		there exists a dotted lift. ([Lur25, Def 006W]/[Lur09], Def 2.0.0.2)

	Nerves		
Name	Domain object	Definition	
Nerve	Category $\mathcal{C}$	$(NC)_n = \{n\text{-composable strings of morphisms in } C\}.$	
Simplicial nerve	Simplicial category $\mathcal C$	$(NC)_n = \operatorname{Hom}_{\mathbf{Cat}_{\Delta}}(\mathfrak{C}[\Delta^n], \mathcal{C}), \text{ where } \mathfrak{C}[\Delta^n] \text{ is the category whose objects are the same as } [n], and \operatorname{Hom}_{\mathfrak{C}[\Delta^n]}(i,j) = \emptyset \text{ for } i < j \text{ and } N(P_{ij}) \text{ for } i \geq j \text{ (where } P_{ij} = \{I \subseteq [n] : (i,j \in I) \land (\forall k \in I, i \leq k \leq j)\}).$	
Topological nerve	Topological category $\mathcal{C}$	The simplicial nerve of Sing $\mathcal{C}$ .	

	Homotopy categories
Domain object	Definition
$\infty$ -Category $\mathcal{C}$	The objects of $hC$ are the vertices of $C$ , and $\operatorname{Hom}_{hC}(X,Y)$ is the set of homotopy classes of edges $X \to Y$ in $C$ . ([Lur09], Prop 1.2.3.9)
Simplicial category $\mathcal{C}$	h C . ([Lur09], 1.1.4)
Topological category $\mathcal{C}$	$hC$ has the same objects as $C$ , and $Hom_{hC}(X,Y) = [Hom_{C}(X,Y)]$ . ([Lur09], 1.1.3)

Categories	
Name	Definition
$\mathbf{Assoc}^{\otimes}$	[todo]
Kan	The full subcategory of <b>sSet</b> spanned by the collec-
	tion of small Kan complexes. ([Lur09], Def 1.2.16.1)
KAN	The category of all Kan complexes. ([Lur09], Rem
	5.1.6.1)
$\mathcal{S}$ (the $\infty$ -category of spaces)	The simplicial <sup>3</sup> nerve $N(\mathbf{Kan})$ .
Ŝ	The simplicial nerve $N(\mathbf{KAN})$ .

 $<sup>{}^3\</sup>mathbf{sSet}$  is a simplicial category, with  $\mathrm{Hom}(X,S)_n = \mathrm{Hom}_{\mathbf{sSet}}(\Delta^n \times X,S)$ . The subcategory **Kan** inherits this structure.
